

Dark matter explained in a Universe Of Dipole Electrons

I will begin by saying that as of the end of 2019 it is realized the Bohr model of Atomic particle nature was not correct. Leptons are the tiny bits and they did not follow the rules of Universality.

My response to the news. https://www.youtube.com/watch?v=hk_AHocsk-8&t=17s

New particles shows Bohr wrong <https://arstechnica.com/science/2019/12/new-boson-hidden-in-beryllium-decay-check-new-physics-maybe/>

I have long thought that Protons and Neutrons were not practical and could not support electron clouds. In addition they were just too large.... IMO the giant Proton and giant Neutron was never viable when considering the plethora of isotopes. So this means it is fair to start over with what we really do know.

What do we know about energy? Can we prove it?

The one thing we are close to understanding is electrons which are electricity and static and lightning and electrons are in light and are the source of heat. Why do I say CLOSE to understanding electrons? Here is why.

In experiments we saw these light particles called photons. ELECTRONS appear as a black and white dot attached as if two balls one against the other. However PHOTONS are two electrons attached in the opposite direction, (back to back/up down) much as two bar magnets. Only the white dots have power...the black dots are charge carriers only. I think the black dots would be called "Gauge Bosons" and the white dots are the explosive power part called a fermion.

In light experiments conducted with pulsed red laser thru a "venturi particle crusher" we were able to see and photo extreme reactive forces. We see (as you will) light accelerating and then as it pulls ahead it displays as a spinning dipole dual electron (back to back/up down) we would call a Photon.

As the light (photons) crushed into the venturi restriction they violated each other photons magnetic region called overlap intrusions and the dipole black and white attached bits leave their appointed positions. The photons of light turned to glowy white plasma. At that spot the dipole charges actually separated and the white "Fermion power" bit explodes with energetic reaction however the black dot seems not to change shape or energy and does exclude itself from energetic changes and even excludes itself from the region entirely....and the black dot does not enter the "White Zone".

After a short settle distance the particles reunite.

What is seen in the videos?

We see the particles... it seems like all of them including Higgs fields and even a reverse spinner that created something very strange and smaller than light.

We see the venturi strongly accelerate the particles exactly as a nozzle in a hose and light to me is alike to the H₂O molecule and I say light is a virtual liquid of electrons.

I have seen The power and non power charges separate and to me that indicates possible fusion capabilities.

The New Atomic Model is "Electron Flood Theory".

Simply stated electrons are all that exist. They are seen as I explained above as black/white dots.

Protons are not a single big pos bit...Protons are a Quantity of electrons called a zone of stability as are neutrons. All elements (atoms and molecules) are simply islands of stable quantities that vibrate with

stability as shown here...watch for the rule of 8...this seems to me to be very similar to atomic structure.

<https://www.youtube.com/watch?v=wwJAgUBF4w>

Protons have approx 1837 electrons and neutrons 1838.

How does this play into Dark Matter?

This explains <https://www.youtube.com/watch?v=KpiRbiJPZhw&t=184s>
