

Dipole Electron Flood Theory (DEFT) 6/01/2023 by Roger H. Spurr

This is a new Atomic model that changes the nucleus from a completely positive into a dipole made of tiny dipoles called Dirac Neutrinos instead of a large positive only core.

Protons and Neutrons are made of dipoles in certain stable quantities that we now call atoms in various sizes.

All Protons are odd numbered dipoles of approx 1823 dipoles and Neutrons are even numbers of dipoles about 1824.

The way the dipole nuclei are set up is a Dark Muon Neutrino Core surrounded by the white Electron Neutrinos like an egg shell around the black center. It appears they are equal in number but opposite in charge.

The particles that make the Nucleus...

The Muon neutrinos are fixed sized solid Black particles that never change size and do not emit or absorb or reflect but they attract the white particles very strongly. That is the Strong Nuclear Force. All flavors of Muons are exactly the same size and shape in our experiments as seen. The color is the spin rate and blue is fastest and red slowest.

The Muons are the Dark Matter and Gravity that we have been searching for. We are normally unable to see Dark Matter (muons) because the dark Muon core is always surrounded by the White Electron coating we never have seen the Dark part until it is separated and sits on top of the White. This simply blocks the white so we see the Black balls on the White Shower.

CERN recently upgraded to use Focusing Magnets (similar to the venturi we use) and CMOS detectors which we also use.

I spoke to Univ of Geneva Professors when I took Particle physics there and showed my experiments and explained focusing and CMOS which at that time they discounted but shortly after CERN shut down to upgrade for "Focusing magnets and CMOS upgrade" exactly as I explained.

"Development of CMOS Sensors for High-Luminosity ATLAS Detectors"

<http://cds.cern.ch/record/2637873>

From 2022... "The Large Hadron Collider is smashing protons again after a three-year hiatus"

The White Electron neutrinos can change sizes depending upon how strongly they are concussed. At rest the White bits seem to almost disappear but in flight these tiny white "Fields" force themselves through the fields of the other molecules and particles of dust and even light fields as they pass by which slows them down.

Every single particle is surrounded by a field which (in flight) causes the particle field duality which has always been referred to. The particle contains the Fixed Black Muon carrier part called a Boson and the Boson is fixed to the White Electron Neutrino Particle called a fermion which has the field energy.

All White parts oppose all other white parts which is "Electric Field" energy.

All black parts attract white parts and form balls in the center of the white coating.

The dark matter only pushes or sucks the white electrons.

What I have spoken of so far is Only the central nucleus but is a dipole. The black core is so attractive it pulls more white parts (electrons) against the core but are not allowed in because the correct number

of electrons is already fully surrounding the Dark Matter Muon core. The additional electrons that want into the center are pushed away by the coating and kept at a quantum distance from the Core...this is what we call the orbiting electrons.

The smallest "Stable" quantity of electron dipoles is a Hydrogen H1. After that Larger and larger cores are larger and larger atoms with larger fields so they are surrounded by more and more orbiting electrons. The orbiting electrons can share with other atoms creating molecules as seen in the standard model.

Isotopes are simply atoms with more or less orbiting electrons and usually are not completely stable....so they have half lives as they absorb or lose the electrons and drift to stability.

That pretty well sums up Dipole Electron Flood Theory.

So what changed from the Standard Model????

The best way to explain is to show the particles as they appear in the experiments.

We used Pulsed lasers and a tuned Field crushing Venturi to create the Sterile Muons and Electron Showers. It is well known and As I will show Photons can be seen using CMOS as we did.

Also the photons are Dipoles Strongly attached to each other but the Venturi if tuned properly will separated the white from the black (fission) and instantly they reattached (fusion) as also will be seen in our experiments.

Definitions from smallest to largest particles.....

Electrons are attached to muons normally and appear to have almost no mass at all but have an extreme attraction to muons and are heat and light and create electricity in conductive materials as they flow from areas of excess electrons to areas with less excess electrons which is simply the flow of heat.

Muons are the tiniest fixed particle and is dark matter and dark energy and is also Cold and Gravity.

Muons have mass and there are approx 1800 or so in each proton. Muons form black holes in all matter and can grow quite large in outer space.

Neutrinos are light that is in travel. The masses change. The change happens until they concuss into photons completely. Neutrinos keep changing their mass values as they stack up against other fields until they concuss as Photons which bounce back depending on what they hit and their starting frequency. We see the bounced particle as a color. Very fast spinning Particles hitting hard surfaces reflect as Blue light and the slower the particle bounces the more Red it shifts towards.

Gluons are simply Dirac Neutrinos consisting of a black and white particle attached. Gluons seem to be electricity and heat which flows when pushed by White electron Fields or pulled by Dark Matter.

Photons are simply 2 Gluons back to back like bar magnets attached.

All other matter is made of these basic particles and as CERN splits protons the end result is Muons and Electron Showers and a Zoo of other particles in other quantities but all contain only muons and electron neutrinos in different masses.

This pretty much sums up Electron Flood Theory....so what changes in chemistry and space?

Due to Dipole Electron Flood Theory what changes in chemistry and space?

Chemistry....The periodic table changes very little however isotopes are now well understood as simply extra or missing electrons in atoms. It has yet to be established if the core can also have extra or missing dipoles that would create new “atoms” or change an atoms ability to create new molecules. chemistry but it seems certain that the orbiting electrons can simply be plump or thin with electrons in orbit.

Space....Everything in Space changes. This is a major change in how we see the Universe and will require a very detailed explanation. We need to address every interaction in the quantum foam of space which is not a vacuum. Space contains lots of dust and charged particles and light and massive bits like Stars and Planets and Moons...comets asteroids etc. Everything in space has magnetic fields around it no matter how small or how big. I have shown light speeds up and slows down and others have proven light can change speed and stay slowed down.....Every bit of light from distant stars passes through these fields and slows down.

The Red Shift and the mistake....100% of light research is based on the Einstein claim that light travels at 186,000 mi/sec in a vacuum but Space is no vacuum so light is slowing down not necessarily being pulled away due to expansion of the Universe. This is the most important impact on the “Space Exploration” claims.

Where are we in the Universe and how far away are other things from us?....

Truth be told...we are lost in Space and have no idea how far anything is from us because the “Golden Rule” that light Never Slows down is known to be wrong but still in 2023 is considered the “Gold Standard” for light.

The second claim that Space is a vacuum is completely obviously wrong and still Strongly embraced by most or possibly every (employed) top physicist to this very day.

A third claim is Electron Flooding in biology.

To Sum it all up.....my claims are backed by material experiments and common sense. The “Laws” of physics are simply wrong guesses that my theory resolves in a simple thoughtful way and any physicist that would like to discuss my work is welcome....however until that discussion takes place My **“DIPOLE ELECTRON FLOOD THEORY” is now the Standard Atomic model and the Old standard model is no more....this is my challenge to mainstream physicists.**

What else do I bring to the table?....

My Youtube channel is called “Mudfossil University” as I cover many bases and discovered that Soft Tissues preserve exceptionally well in certain conditions. I presented my work on Mudfossils to Yale and they agree and wrote this paper about a year later in November 2016 confirming my claims. I worked with Derek Briggs at Yale in 2015.

YALE ON SOFT BODY PERFECT PRESERVATION from my research but as usual no credit to me.
