

Gold processing the tailings and ancient monumental stone works 10-20-2015

In the process of studying the Atomic properties of "Manna" (mon-atomic gold) I realized the quantity of tailings must have been enormous. If used in a certain manner, it solves many mysteries I believe. This led me to believe many ancient constructions and artifacts of "stone" and cart ruts etc were actually tailing debris reconstituted EXACTLY as we would do today. I just ran across evidence supporting my "Manna Building material" theory. The Pyramids may be tailings. I think cylinder cuts and such were done in wet putty, that could account for rapid cutting grooves. These chemical and physical signatures and features should be noticeable with extreme scrutiny. [<http://www.geopolymer.org/.../pyram.../pyramids-2-the-evidences/>] Other things, giant walls and such were molded like clay.

Gold production leaves lots of tailings. These will be different in each region but ALL will be mineral rich crushed and washed ..Very homogeneous crystals of all sorts (High Quality construction material)....add a little red ochre and you got rose granite....lots of silicon dioxide and you get black.....correct PH and you got white, all the while getting gold also. This is the source of Manna. [<https://www.youtube.com/watch?v=nfdxxyT7Dco>]

This sludge will NATURALLY over time (crystalize) bond and turn to STONE and it appears from the article and test results above that the ancient pyramid stones are distinguishable from "NATURAL" rock crystals. (see the pictures of dis-similarity). The end result is a homogenous small ground stone chunks of minerals missing most of the metals. This stone is exactly like granite....or can be refined further to create whatever was chemically sorted (refined). There are rumors of ancient stone binders that need following up on.

These people were ingenious and certainly understood chemistry PH (likely electricity) and its uses. I am sure they could catalyze this hardening process. Much of these deposits are "INTRUSIVE". TRANSLATION...Not supposed to be there. My take is that much rock in these HOMOGENOUS INTRUSIONS are gold leftovers and was put to good use. Cart ruts and Tellingers footprint and Molding in walls etc is seen EVERYWHERE. Your counter top might even be this stuff.

This deserves a thoughtful consideration, it is pure speculation but every original thought is pure speculation...simple musing until considered by authorities...please consider this. Chemistry will tell the story...no real mysteries just books unread.
