

“Life as an Alternative Geological process leading to observed mineral concentrates and rock formations”

I am clearly not an Academic. Please excuse the (crude) straight forward approach I use, it is the only way I know. I hope the content is clear. This is clearly not the current theory...understood! Please email me about factual mistakes you notice in my presentation, I am interested to be accurate.

This Document is an Introduction to a broader work including.... ”Electro Mud Fossilization by natural Spontaneous Electric Potentials” ...“Silicon and Fascia's role in mud fossils.”...”Organic transition to fossil gases and fuels”...mineral crystallization of VOC voids after sublimation”...”Mineral concentrations by life origination.”...”Living Earth, Blue holes and collapsing Tundra sink holes” ...

“This body of work examines each specimen and each clue on its merits and in relation to other specimens and events. The videos and docs are more of an investigation of “Causality” which requires an explanation of Physical evidence. Based on my esearch...I disagree with much of Geology as taught in 2015.

It is essential to understand that geology is an "unobservable" science. Long thought to be hard fact, Geology is actually speculation based on best guesses....wrong guesses in my opinion.

CAT SCANS

Mudfossils.com has many soft tissue fossils with cat scans clearly showing a finger nail bed, areolar tissue, bone, apacle tuft, etc. VIDEO of ct finger

DNA

Samples were carefully gathered...Sealed and labeled...sent to Helix Bio-analytical lab in Michigan for analysis...DNA was extracted...contols were in place...Mitochondrial fragments 100base pairs approx isolated from each sample...sequenced...result 100% consistant with Humans (like us).

PROCESS RECREATION

Mud fossilization of soft tissue by natural electrolysis is best in continuously wet micro silicates...mud. These specimens are available “physical” specimens which remain unexamined and ignored as if they did not exist. I would like an OFFICIAL accepted lab to analyze them. I have Ct scans...DNA sequenced...anatomical structural analyst agreement...Soft tissue mud fossilization process RECREATION in the LAB of the mudfossil process...chemistry works (doc attached). observations of metamorphic, igneous, tectonites and all the crazy crystal formations pointed to a process that made "partial" sense but how did the concentration occur?

1...the part that made sense was the temp, pressure, duration etc could lead to the observed rocks/crystals, fossil fuels and gases etc.

2...the part I dispute is mineral recrystallization by flocculation. it is not explained, simply excepted...”must be”. Flocculation RESTS on the assumption that elements and molecules MUST gather miraculously.

3...life is an excellent flocculator. These concentrations of chemicals are quite well known...urine...stomach acids etc...and show up in differing proportions in the body. Silicon is 50 times more concentrated in skin than most other body locations...calcium and phosphorous in bone...copious concentrations of Iron in blood and marrow...carbon in DCL membranes...PH manipulation...one big chemical erector set.

4... human anatomy ...skin ...fascia ...protective membranes ... chem concentrations in humans vs mud fossils... They are similar and found in EXCATLY the places expected. (1)
